(54) MONITOR FOR MONITORING INSTALLING POSITION OF COMMUNICATION APPARATUS AND MONITOR SYSTEM

(57)Abstract:

PROBLEM TO BE SOLVED: To provide a monitor system which two- or three-dimensionally displays the installing spot of a communication apparatus being monitored by a monitor at a proper position on a map

shown in a terminal screen of the monitor.

SOLUTION: The position monitor system comprises a communication apparatus and a monitor for monitoring the communication apparatus. The communication apparatus comprises a means for acquiring present position information, a means for generating a network management message (e.g. SNMP message), and a means for sending the generated network management message to the monitor. The monitor comprises a means for extracting the position information from the received network management message, and a means for mapping the position information of the communication apparatus on map information to display the information on the terminal screen.
